Installation Technical Manual

Typical Applications
Typical Sub-trade Applications

## Heating <br> Applications

Heating is the general term applied to the system used to raise and maintain the ambient temperature inside a building at a comfortable level. Several different principles are employed. Most widespread in central Europe are systems where heat is produced locally in a unit located in the plant room or associated room in or adjacent to the building. This heating unit (e.g. gas heater) heats the heating media directly, which is then distributed through the piping system to the places of final radiation (e.g. radiators or floor heating).

Other principles employed in large building complexes include the use of centralized district heating (either purpose-built heating plants or those designed to utilize waste energy, e.g. from a power plant or waste incineration plant) with a primary heating media such as steam. This primary heating media is distributed through underground pipes to local plant rooms in the buildings to be heated. The primary heating media then passes through a heat exchanger, thereby raising the temperature of the secondary heating media. The system used to distribute the secondary heating media in the building is exactly the same as in the local system described above.

Several other principles are in use mainly in Northern Europe, where local heating units are combined with air conditioning and ventilation systems. Advanced technologies associated with green building and passive building are also gaining acceptance for use in heating systems, but still on a very limited scale and generally only where very local or just-in-case back-up solutions are required.
The system described in this manual reflects the most widespread solutions found in the commercial building segment in Central Europe. The heating media begins its journey in a local heating unit or boiler in a plant room before passing through a splitter, from which various branches then continue on into pipe corridors and rising shafts for final distribution to the places of final consumption or radiation.

Heating pipes running along corridors are typically installed on common supports together with other services.

1
Single fastening
Pipes are typically suspended from the ceiling on a pair of swiveling elements or other extension elements.

Cantilever arm
Cantilever pipe support arm (pipes standing or suspended) in the form of a preassembled / pre-welded unit or assembled from individual parts with vertical or pipe axial braces.

## Splitter frame

A frame made from channels supporting splitters or measuring and regulation devices of various dimensions or supporting both types of plant room equipment together.

## Axial guide support frame

Frame structure designed to provide axial guidance to the pipes before and after technical compensation of expansion.

Primary heating media collector bracket
Typical solutions for underground collectors or various special pipe corridors. Frame structures suitable for various geometries and loading conditions.

 Head rail
A channel directly attached to the ceiling, typically using anchors, either through bolting the channel or fixing the channel from the bottom directly. The pipes are suspended either on swiveling or expansion elements.

Natural compensation zone trapeze
The same as application 3 , but subjected to axial and lateral pipe loads on transverse (cross) sliding elements.

Plant room equipment / switch box support frame
Frame structure typically braced between the floor and ceiling, supporting various devices, e.g. switch boxes.

## Fixed points

Standard fixed point set ensuring control of the pipe expansion.

Various other applications
Includes various hybrid structures designed to support particular parts of heating systems.

Trapeze frame
A length of channel fastened to two or more vertical upright channels supporting a group of suspended or standing pipes mounted on expansion elements

Riser guides
A length of channel directly anchored to the wall using anchors. Pipe rings mounted on expansion elements provide guidance for rising pipes.

## Plant room framing - 3D frame

3D frame structure supporting heavy plant room equipment e.g. boilers in various sizes and dimensions.

## Riser fixed points

Standard fixed point sets to take up riser pipe loads.

## Terms of common cooperation / legal disclaimers

Hilti strives to achieve continuous development and innovation. This manual is thus subject to change without notice. Hilti strongly advises customers to verify the respective product application for the intended use by consulting a structural engineer and making the necessary calculations to ensure compliance with the applicable norms and standards. It is essential that the product is used strictly in accordance with the applicable Hilti instructions for use and within the application limits specified in the Hilti technical data sheets, technical specifications and supporting product literature. Due to the fact that construction materials and environmental conditions vary widely, information given in this manual is solely based on principles and safety factors believed to be correct at the time they were established. The customer is ultimately responsible for checking the present condition of supporting materials and the applicability of the selected product application. Hilti shall not be liable for direct, indirect, incidental or consequential damages, losses or expenses in connection with any information contained in this manual or in connection with, or by reason of, the use of, or inability to use the products for any intended purpose. This limitation of liability does not apply to personal damages culpably caused by Hilti. Implied warranties of merchantability or fitness of the products are herewith expressly excluded.

## Loading capacity limit

All loading capacity limits in this manual are to be considered as recommended values. Recommended values are calculated from the elastic limit equal to yield strength, with an applied material safety factor of 1.1 and an applied additional safety factor of 1.4.

Recommended load approach

## Technical background information

### 1.0 Thermal expansion

## Technical challenges and how these dictate the product requirements

Heating

The major challenge when fastening heating pipes is thermal expansion of the pipe and its impact on pipe supports and the surroundings.

Thermal expansion leads to extension of the length of the pipe and depends on three basic parameters:

Examples of materials and their coefficients of expansion

| Material | Coefficient of <br> expansion | Example for 10 m, <br> $\Delta T 50^{\circ} \mathrm{C}$ |
| :--- | :--- | :--- |
| Steel St 37-2 | 0.0000111 | 5.55 mm |
| Stainless steel | 0.000016 | 8.00 mm |
| Cast iron | 0.0000105 | 5.25 mm |
| Copper SF-Cu | 0.0000168 | 8.40 mm |
| Polyethylene PE 100 | 0.00018 | 90.0 mm |

### 2.0 Controlled expansion

## Expansion must be controlled

What can happen in the event of uncontrolled expansion - the impact of expansion on pipe supports

Example showing pipes on standing supports

Example showing suspended pipes

Both cases may lead to irreversible deformation, huge displacements, wrong load re-distribution and ultimately to chain reactions causing pipe collapse.

## Uncontrolled expansion - impact on supports and surroundings

What can happen in the event of uncontrolled expansion - the impact of expansion on pipe supports

It may, by coincidence, have little effect, i.e. the pipe system is able to take up the movement.

Some of the supports may detach.

An expanding element may exert pressure against the surrounding structure, which is not designed to carry these loads.

The expanding element exerts pressure between two rigid structures, thereby subjecting it to inner stress, possibly leading to breakage.

Ignoring the control of thermal expansion can have many more negative effects. The cases above represent the majority of the problems encountered in the installation of pipes.

## Controlling expansion - methods used to control expansion

Expansion must be controlled. Its impact can then be predicted and calculated.

Fixed (anchor) point at one end, compensation for expansion at the other end.

Fixed (anchor) point in the middle, compensation for expansion at both ends.

Fixed (anchor) points at the ends and space designed to provide compensation for

Fixed (anchor) points at the ends and a mechanism designed to provided compen-

A system for controlling expansion always consists of a set of fixed points and a means of compensation.

### 3.0 Fixed point

## Fixed points - placement

Generally, a good starting point is the following basic rule: For every straight section of pipe with a diameter of $21 / 2 "(76.1 \mathrm{~mm})$ or more and a length of 10 m or more, expansion must be controlled by a fixed point in the middle of the run.

Some plant room equipment may be subject to a risk of destabilization or damage by pipe axial forces. Protection at the start of the run is therefore required in some cases.

Plant room equipment with fixed point protection

Axial force caused by expansion

Plant room equipment without fixed point protection

## Fixed points - loads

The basic function of a fixed (anchor) point is to anchor the pipe in a place where the building structure is designed to carry loads generated by expansion and to thus ensure zero movement of the pipe. This control of the pipe will generate certain loads due to several factors, depending on the type of compensation used:

Loads generated at a fixed point by natural compensation:
$\mathrm{F}_{\mathrm{CR}}$ - Resistance of compensation (elbow, u-bend..)
$\Sigma \mathrm{F}_{\mathrm{FR}} \quad$ - Friction at all pipe supports
Information about detailed calculation can be found in the "Natural compensation" section.

Loads generated at a fixed point by technical compensation:
$\begin{array}{ll}\mathrm{F}_{\mathrm{SR}} & \text { - Load generated by spring rate of the expansion joint } \\ \mathrm{F}_{T P} & \text { - Media pipe pressure } \\ \Sigma \mathrm{F}_{\mathrm{FR}} & \text { - Friction at all pipe supports }\end{array}$
Information about detailed calculation can be found in the "Technical compensation" section.

## Fixed point load transfer principles

Most of the Hilti fixed point sets work on the stand and brace principle, thereby splitting the load into two parts on a triangular principle.

Braces in Hilti fixed point sets are made from M16 threaded rods.
The threaded rod must be subjected to tension only.
The orientation of the brace must reflect this.
The brace must be subjected to tension only.
In cases where you are not sure, or the brace can be even temporarily subjected to opposite loads (when the system is heating up or cooling down), we recommend that braces are fitted on both sides.

## Fixed point versus loading capacity of the structure

Placement of fixed points should always take the loading capacity of the building structure into account. The structural engineer responsible for the structure must always be consulted about the impact of the fixed point.

The cases mentioned below are examples of situations that could present a risk to the stability of the building structure or any other sub-structures.

The cases are explained on the basis of a fixed point load of 10 kN acting on an arm at a distance of 1 m from the supporting material.

$\mathrm{FFP}_{\mathrm{FP}}=10 \mathrm{kN}$

10 kN may exceed the spot loading capacity of a concrete slab and the loads acting in this way may pull out the entire anchor (on the brace of the fixed point).

Load transfer to the girder may subject it to torsion or other mechanisms that could impact its stability.

$F_{F P}=10 \mathrm{kN}$

$F_{F P}=10 \mathrm{kN}$

### 4.0 Compensation

## Types of compensation - natural compensation

U-bend and fixed points

Z-bend and fixed points

L-bend and fixed points

U-bend

Z-bend

L-bend

## Types of compensation - technical compensation

## Important notice

The expansion joint supplier must be consulted about placement of fixed points and the accommodation of expansion. His instructions regarding design and installation must be strictly followed.

## Axial expansion joints

Axial expansion joints and fixed points

Angular expansion joints and fixed points

Two types of angular expansion joints:

1. Planar - one axis of rotation
2. Spatial - gimbal types

## Lateral expansion joints

Two types of lateral expansion joints:

1. Planar - one axis of rotation with own control of pipe pressure
2. Spatial (circular) - multidirectional with own control of pipe pressure

Able to absorb multidirectional lateral movement

Lateral expansion joints and fixed points

## Natural compensation - zones and typical solutions

## Natural compensation - zones

## Expansion impact zones

Upper surface of channel

## Quiet zone

At this pipe zone the impact of expansion is negligible - no special measures are required.

Pipes on standing supports

## Pipes on standing supports

## Suspended pipes

## Loading scheme

## Weight

Pipe runs can be divided into zones according to the impact of expansion on the pipe supports. The zones are defined differently for pipes on standing supports and for suspended pipes.
The main factors are expansion along the pipe axis and distance from the upper surface of the channel (in the case of pipes on standing supports) and expansion along the pipe axis and distance from the underside of the supporting structure (in the case of suspended pipes).

Underside of the supporting structure

The pipe supports must be designed to take up the vertical load resulting from the weight of the pipe section (only for relevant applications). See section "Typical plumbing applications".

## Expansion zone

This is the zone in which expansion begins to have an impact in axial direction. Traditional methods of pipe installation begin to run out of options and use of special expansion elements becomes necessary.
Ignoring expansion would result in torque moment in channels, significant displacement of threaded rods and irreversible deformation of several parts. All of these impacts could lead to a chain reaction and, in extreme cases, to collapse of the pipe support system.

Pipes on standing supports

\forall<15^{\circ}
$$

In the expansion zone it is necessary to make use of expansion elements that properly distribute expansion forces to the supporting structure.
The pipe support must be designed acording the loading scheme:
$\gamma>15^{\circ}$

Loading scheme

Weight

This leads to use of special solutions:

Sliding/rolling elements

## Compensation zone

Pipes on standing supports

In this zone, the expansion impact meets natural compensation achieved by the spring effect (resistance) of the system. Compensation tends to comprise movement in several directions during the heating-up or cooling-down phases. The pipe supports must therefore allow all of these movements and be able to transfer the loads properly to the supporting building structure.

## Suspended pipes

$$
\forall>7^{\circ}
$$

$X>15^{\circ}$
$\quad<15^{\circ}$

## Loading scheme

This leads to use of special solutions:

Cross sliding/rolling elements

## Friction

$F_{\text {Weight }}=$ weight of 1 m pipe $x$ spacing
$F_{\text {Friction }}=F_{\text {Weight }} \times \mathrm{Y}$
$\psi=$ specific friction factor for slider/roller

Every expansion element will allow pipe movement, but will generate horizontal force due to friction in the element.
As a consequence, the pipe supports are subjected to the following loads:

Two loads where double sliding/rolling elements are used.

Two loads and one moment (torsional) where single sliding/rolling elements are used.

Recommendation: Always use double sliders/rollers on open-section profiles (MQ system)

Friction - galvanized elements

*For higher temperatures above $100^{\circ} \mathrm{C}$ use reduction factors $\mathrm{k}_{\mathrm{p}, \mathrm{e}}$ as per DIN EN 1993-1-2:2005 + AC 2005 (D)

Friction - hot-dip galvanized elements

| Type | Item number | Loading capacity (kN) | Friction $4\left({ }_{-}\right)$ | Expansion capacity (mm) |  | Temperature resistance ( ${ }^{\circ} \mathrm{C}$ ) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MSG 2.0 M10/12-F | 304213 | 1.5 | 0.15 | 40 | 80 | -40 | +300 |
| MRG-D6 M12/16-F | 302214 | 6.0 | 0.15 | 58 | 116 | -40 | +300 |

Friction - stainless steel elements

| Type | Item number | Loading capacity (kN) | Friction 4(_) | Expansion capacity (mm) |  | Temperature resistance $\left({ }^{\circ} \mathrm{C}\right)$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MRG 2.0 M10/12-R | 304086 | 1.5 | 0.15 | 40 | 80 | -40 | +300 |
| MRG-D6 M12/16-R | 304087* | 6.0 | 0.15 | 58 | 116 | -40 | +300 |

* Manufactured only on request
$S_{\min }=\sqrt{\frac{3 E}{2 \sigma_{z u l}}} * \sqrt{\Delta L * A D}$
$\mathrm{E}=$ Modulus of elasticity of pipe material (temperature dependent)
$\sigma_{\mathrm{zul}}=$ Allowable stress on pipe material (temperature dependent and load factor included - yield stress / safety factor)
$\Delta L=L * \Delta T * \alpha$
$\Delta T=T_{\text {max. }}-\mathrm{T}_{\text {inst }}$
$\alpha=$ Coefficient of pipe material expansion
$\mathrm{L} \quad=$ Length between fixed point and bending arm
$T_{\text {max. }}=$ Max. operational temperature e.g. heating media temperature $70^{\circ} \mathrm{C}$
$\mathrm{T}_{\text {inst }}=$ Installation temperature (temperature at which the fixed points were tightened) e.g. $20^{\circ} \mathrm{C}$
AD = Outside diameter of pipe material

Installation of a pipe support before the point of zero rotation would subject the pipe support to lateral loads and, at the same time, it would increase the load at the fixed point (the value depends on lateral resistance of the pipe support).

## Elbow resistance

## Point of zero rotation

The important point is the so-called point of zero rotation. It is the point where expansion has no further (negligible) influence after natural compensation.

## Fixed point loads

$$
F_{F P}=F_{C R}+F_{F R}
$$

$\mathrm{F}_{\mathrm{CR}}$ - Resistance of compensation (elbow, U-bend, etc.)
$\Sigma \mathrm{F}_{\mathrm{FR}}$ - Friction load in all pipe supports

$$
\mathrm{F}_{\mathrm{CR}}=\mathrm{E} \times I \times\left(\Delta \mathrm{L} \times 3 / \mathrm{s}^{3}\right)
$$

E - Modulus of elasticity
I - Moment of inertia of the pipe
$\Delta \mathrm{L}$ - Expansion of the pipe
S - Bending arm

## $\mathrm{F}_{\mathrm{FR}}=\mu \times \mathrm{M} \times \mathrm{L}$

$\mu \quad$ - Friction factor
M - Weight of the pipe: 1 m , water-filled, incl. insulation
L - Length of the pipe section from fixed point to bending arm

Natural compensation - rules to follow for safe design / control of expansion

Rule no. 1

Never two fixed points on the same pipe without compensation between.

## Rule no. 2

Every compensation must be accompanied by one fixed point on each side.

## Rule no. 3

## Natural compensation - special cases

Mainly in the industrial segment, the preferred method of achieving even more control of expansion involves placement of a fixed point at the U-bend arm.
The only difference here is that the last support and all supports up to the point of zero rotation must have cross sliding/rolling elements to allow lateral compensation.

In situations where the pipe support has to be placed very close to the elbow (between the point of zero rotation and the elbow) due to exceeding the max. spacing or loading capacity limits, the pipe supports must allow multidirectional movement and the entire frame structure must be designed to carry these vertical, axial and lateral loads. Cross sliding elements with sufficient traveling capacity must be used.

## Technical compensation - zones and typical solutions

## Technical compensation - zones

Expansion impact zones

Upper surface of channel

## Quiet zone

At this pipe zone the impact of expansion is negligible - no special measures are required.

Pipes on standing supports

## Suspended pipes

## Loading scheme

## Weight

Pipe runs can be divided into zones according to the impact of expansion on the pipe supports. The zones are defined differently for pipes on standing supports and for suspended pipes.
The main factors are expansion along the pipe axis and distance from the upper surface of the channel (in the case of pipes on standing supports) and expansion along the pipe axis and distance from the underside of the supporting structure (in the case of suspended pipes).

Underside of the supporting structure

The pipe supports must be designed to take up the vertical load resulting from the weight of the pipe section (only for relevant applications). See section "Typical plumbing applications".

## Expansion zone

This is the zone in which expansion begins to have an impact in axial direction. Traditional methods of pipe installation begin to run out of options and use of special expansion elements becomes necessary.
Ignoring expansion would result in torque moment in channels, significant displacement of threaded rods and irreversible deformation of several parts. All of these impacts could lead to a chain reaction and, in extreme cases, to collapse of the pipe support system.

Pipes on standing supports

## Suspended pipes

$$
\forall>7^{\circ}
$$

$$
\forall<15^{\circ}
$$

In the expansion zone it is necessary to make use of expansion elements that properly distribute expansion forces to the supporting structure.
The pipe support must be designed acording the loading scheme:
$\gamma>15^{\circ}$

Loading scheme

Weight

This leads to use of special solutions:

Sliding/rolling elements

## Compensation zone

Uncontrolled expansion leads to irreversible deformation and in many cases to collapse of the pipe system.

In this zone, the expansion impact meets technical compensation and its resistance. Technical compensation (axial) behaves like a spring under pressure. This leads to unpredictability regarding the direction of the spring-back effect. An uncontrolled spring-back effect would lead to irreversible deformation of the expansion joint and would subject the pipe supports to unpredictable loads in unpredictable directions. The expansion joint must therefore be controlled by fitting suitably engineered axial guides at exactly the required distance from the expansion joint and at both sides of the joint.

Number (2-3) of correctly designed axial guides placed at the required distances for safe control of the expansion joint.

## Loading scheme

Finding worst case combination and loading case impact on axial guidance

This leads to use of special solutions:
$2 x-3 x$ correctly designed axial guides placed at the required distance on both sides of the expansion joint.

Hilti strongly advises customers to verify the respective product application for the intended use by consulting a structural engineer and making the necessary calculations to ensure compliance with the
Page 40 applicable norms and standards. Failure to consult and heed the advice of a structural engineer will free Hilti from any liability. It is essential that the product is used strictly in accordance with the applicable Hilti instructions for use, within the application limits specified in the Hilti technical data sheets, technical specifications and supporting product literature, and that the relevant application limits are not exceeded at any time. All rights reserved by Hilti Corporation. Duplication, utilization and/or publication of drawings contained in this manual are not permitted unless expressly agreed by Hilti Corporation.

## Axial guidance

Underestimation of the need for axial guidance may lead to significant problems, irreversible deformation or even collapse.

Hilti Engineering Services will help you to calculate and design the right solutions. PC software that allows you to manage the whole design of systems subjected to multidirectional loads is also available from Hilti (Hilti PROFIS Installation).

After finding the worst-case combination of loads, the loads can be entered in the 3D module of Hilti PROFIS Installation:

1. Beam model of the application
2. Set the load combination
3. 3D verification of all beams and connectors
4. Calculation report
5. ACAD/BIM export
6. Shop drawings
7. Bill of materials for the project

## Fixed point loads

$$
\mathrm{F}_{\mathrm{FP}}=\mathrm{F}_{\mathrm{TP}}+\mathrm{F}_{\mathrm{SR}}+\mathrm{F}_{\mathrm{FR}}
$$

$\mathrm{F}_{\mathrm{TP}}$ - Pipe pressure load
$F_{S R}$ - Spring rate load
$F_{F R} \quad$ - Friction load in all pipe supports

## $\mathrm{F}_{\mathrm{TP}}=10 \times \mathrm{P} \times \mathrm{A}$

P - Design value for pressure
A - Effective area of compensator (see manufacturer's data)

## $F_{S R}=\Delta L \times C$

$\Delta \mathrm{L}$ - Expansion of the pipe
C - Spring rate of the expansion joint (see manufacturer's data)
Note: In case of pre-tightened expansion joints $\mathrm{F}_{\mathrm{SR}}=2 \times \Delta \mathrm{L} \times \mathrm{C}$
$\mathrm{F}_{\mathrm{FR}}=\mu \times \mathrm{M} \times \mathrm{L}$
$\mu \quad$ - Friction factor
M - Weight of the pipe: 1m, water-filled, incl. insulation
L - Length of the pipe esction from fixed point to bending arm

Technical compensation - rules to follow for safe design / control of expansion

## Rule no. 1

Never two fixed points on the same pipe without compensation between.

## Rule no. 2

Every compensation must be accompanied by two fixed points - one on each side.

## Rule no. 3

Every fixed point must be braced on both sides.

Rule no. 4

The fixed point between two compensations must be designed to take up a single load action - the higher of the two potential loads.

## Rule no. 5

Axial expansion must be accommodated by *two or three correctly engineered axial guides on both sides at the proper distance.

| - Application subject to thermal expansion impact, no seismic, no fatigue no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Pipe rings |  |

## Heating Applications - Single Fastening

## Type H-SF5

- Limited to 1x DN 50 (O.D. 60.3 mm ) steel pipe
- Spacing - support distance 3 m
- Insulation 40 mm rubber

Additional loading capacity limits
This particular case
$\mathrm{F}_{\mathrm{w}}=0.25 \mathrm{kN}$ recommended load

| Bill of materials |  |  |  |  |

Application description
Heating - single fastening M8

## General comments

- Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact
- Loading and load impact must always be compared with 3D capacity limits for every single part of the application

Application
1
Base material Concrete
Product line Sliders, anchors
Capacity limit 1x DN50 steel

## Heating Applications - Single Fastening

## Type H-SF6

- Limited to 1x DN 80 (O.D. 88.9 mm ) steel pipe
- Spacing - support distance 3 m
- Insulation 40 mm rubber

Additional loading capacity limits
This particular case
$F_{w}=0.51 \mathrm{kN}$ recommended loads

$F_{\text {max. }}=0.51 \mathrm{kN}$ recommended loads

## Bill of materials

## Head Rail On Concrete - <br> Options For Connection To Concrete

| Application description | Application | Product lines | Base material |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Heating - head rail |  | MQ System | Concrete |  |
| General comments |  |  | Anchors |  |
|  |  |  |  |  |
| - Application subject to thermal expansion impact, no seismic, no fatigue, |  |  |  |  |
| no high/low temperature impact |  |  |  |  |
| - Loading and load impact must always be compared with 3D capacity |  |  |  |  |
| limits for every single part of the application |  |  |  |  |

## Head Rail On Concrete - <br> Options For M8, M10 Pipe Connections

## Heating Applications - Head Rail

## Type H-HR1

- Limited to max. 4 x DN 80 (O.D. 88.9 mm) water-filled steel pipe
- Spacing - support distance 3 m
- Insulation 20 mm elastomeric caoutchouc

## Additional loading capacity limits

The loading capacity limit is set by many different parameters for this complex case. Exceeding any (even only one) of the parameters shown in red would result in exceeding the limitation factors for this particular case.
This would make it necessary to carry out the complete static calculations and may lead to selection of different products and dimensions.

Limited to max. 4x DN 80 (O.D. 88.9 mm ) water-filled steel pipe

| - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Capacity limit | $4 \times$ DN 125 concrete |

Head Rail On Concrete Options For M12, M16 Pipe Connections

## Heating Applications - Head Rail

## Type H-HR4

- Limited to max. $4 \times$ DN 200 (O.D. 219.1 mm) water-filled steel pipe
- Spacing - support distance 3 m
- Insulation 20 mm elastomeric caoutchouc

## Additional loading capacity limits

The loading capacity limit is set by many different parameters for this complex case. Exceeding any (even only one) of the parameters shown in red would result in exceeding the limitation factors for this particular case.
This would make it necessary to carry out the complete static calculations and may lead to selection of different products and dimensions.

Limited to max. 4x DN 200 (O.D. 219.1 mm) water-filled steel pipe

| 2x M10 hex. nut | 216466 |
| 1x M10x25 hex. Screw | 216454 |
| 1x MQZ-L11 square washer | 369679 |
| 1x MQM-M10 wing nut | 369626 |

| Application description |
| :--- |
| Heating - cantilever arm |
| General comments |
| - Application subject to thermal expansion impact, no seismic, no fatigue, |
| no high/low temperature impact |
| - Loading and load impact must always be compared with 3D capacity |
| limits for every single part of the application |

## Cantilever Arm On Concrete - <br> Side (Axial) Bracing With Pre-fab. Braces

Bracket with short pre-fab. brace

| For double brackets min. arm 450 mm |  |
| :--- | ---: |
| Cantilever arm |  |
| 1x MQK cantilever arm |  |
| MQK-21D/450 | 369618 |
| MQK-21D/600 | 369619 |
| MQK-41D/1000 | 369620 |
| Side brace | 369622 |
| 1x MQK-SK pre-fab. brace | 369623 |
| 1x MQN push button |  |
| 3x Anchor | 2079914 |
| HUS3-H 10x90 35/15/5 screw anchor |  |
| or | 2105718 |
| HST3 M12x105 30/10 stud anchor | 2107848 |
| HST2 M12x105/10 stud anchor |  |

Bracket with long pre-fab. brace

| For double brackets min. arm 600 mm |  |
| :--- | :--- |
| Cantilever arm |  |
| 1x MQK cantilever arm |  |
| MQK-21D/600 | 369619 |
| MQK-41D/1000 |  |
| Side brace | 369620 |
| 1x MQK-SL pre-fab. brace | 369623 |
| 1x MQN push button |  |
| 3x Anchor |  |
| HUS3-H 10x90 35/15/5 screw anchor | 2079914 |
| or |  |
| HST3 M12x105 30/10 stud anchor | 2105718 |
| HST2 M12x105/10 stud anchor | 2107848 |

| Application description |
| :--- |
| Heating - cantilever arm |
| General comments |
| - Application subject to thermal expansion impact, no seismic, no fatigue, |
| no high/low temperature impact |
| - Loading and load impact must always be compared with 3D capacity |
| limits for every single part of the application |

## Cantilever Arm On Concrete - <br> Side (Axial) Bracing Using Channel

Double bracket with standard connectors and braced with channel

Bracket 41 mm format with MQ3D elements and braced with channel

## Gantilever Arm On Concrete Vertical And Side Bracing (Pre-fab.)

Cantilever arm with vertical and side (axial) bracing using pre-fab. braces
For brackets with min. arm of 600 mm

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - cantilever arm |  | MQ system | Concrete |
| General comments <br> - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Anchors |  |

## Cantilever Arm On Concrete - Slider Fastening

Use of slider is associated with axial loads, making side (axial) bracing necessary

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - cantilever arm | $4$$0$ | MQ system | Concrete |
| General comments <br> - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Sliders / rollers |  |

## Heating Applications - Cantilever Arm

## Type H-CA1

- Limited to max. $2 \times$ DN 65 (O.D. 76.1 mm) water-filled steel pipe
- Spacing - support distance 3 m
- Insulation 20 mm elastomeric caoutchouc

## Additional loading capacity limits

The loading capacity limit is set by many different parameters for this complex case. Exceeding any (even only one) of the parameters shown in red would result in exceeding the limitation factors for this particular case.
This would make it necessary to carry out the complete static calculations and may lead to selection of different products and dimensions.

Limited to max. $2 \times$ DN 65 (O.D. 76.1 mm ) water-filled steel pipe

## Bill of materials

| Reference | Item no. | Description | Piece | Length (m) |
| :---: | :---: | :---: | :---: | :---: |

## Natural Compensation Zone Trapeze Fastening Cross Slicling / Rolling Elements

## Heating Applications - Natural Compensation Zone Trapeze

## Type H-NCZT1

- Limited to max. 2 x DN 80 (O.D. 88.9 mm) water-filled steel pipe
- Spacing - support distance 3 m
- Insulation 20 mm elastomeric caoutchouc

## Additional loading capacity limits

The loading capacity limit is set by many different parameters for this complex case. Exceeding any (even only one) of the parameters shown in red would result in exceeding the limitation factors for this particular case.
This would make it necessary to carry out the complete static calculations and may lead to selection of different products and dimensions.

Limited to max. $2 \times$ DN 80 (O.D. 88.9 mm ) water-filled steel pipe

## Heating Applications - Plant Room Equipment Support: Splitter Frame

## Type H-PR-SF5

- This example for splitter DN 350 (O.D. 372 mm )
- Outgoing pipes $6 \times$ DN 80 (O.D. 88.9 mm )
- No particular loading capacity limits for this case since every case must be modeled, calculated and verified individually

## Additional capacity limits

Every case must be modeled, calculated and verified individually.

Strength, rigidity and convenience are more important than finding the most cost-efficient solution when installing plant room equipment.

## Plant Room Framing - Simple 3D Frame: Node Options

## Heating Applications - Plant Room Equipment Support: 3D Frame

## Type H-PR-3D2

- No particular loading capacity limits for this case since every case must be modeled, calculated and verified individually

## Additional capacity limits

Every case must be modeled, calculated and verified individually.

Strength, rigidity and convenience are more important than finding the most cost-efficient solution when installing plant room equipment.

## Bill of materials

| Reference | Item no. | Description | Piece | Length ( m ) |
| :---: | :---: | :---: | :---: | :---: |
| (1) | 369613 | MQK-41/600/4 bracket | 4 | - |
| (2) | 369623 | MQN push button | 16 | - |
| (3) | 2105718 | HST3 M12x105 30/10 stud anchor | 16 | - |
| (4) | 369685 | MQZ-E41 end cap | 4 | - |
| (5) | 369601 | MQ-21D 3 m channel | 2 | Depends on width of the frame |

| (7) | 369641 | MQV-3/3 D 3D connector | 4 | - |

Application description
Heating - plant room equipment support: 3D frame
General comments

- Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact
- Loading and load impact must always be compared with 3D capacity limits for every single part of the application

Application

Base material Concrete
Product line MQ System
Capacity limit Individual

## Plant Room Framing - Simple 3D Frame: Space Bracing Options

Space bracing with MQ-3D elements using threaded rods

| Application description |
| :--- |
| Heating - plant room framing: 3D frame |
| General comments |

## Heating Applications - Plant Room Equipment Support: 3D Frame

## Type H-PR-3D3

- No particular loading capacity limits for this case since every case must be modeled, calculated and verified individually

## Additional capacity limits

Every case must be modeled, calculated and verified individually.

Strength, rigidity and convenience are more important than finding the most cost-efficient solution when installing plant room equipment.

Prerequisite for space bracing shown: The equipment mounted on the 3D frame ensures rigidity of the upper horizontal plane.

Hilti strongly advises customers to verify the respective product application for the intended use by consulting a structural engineer and making the necessary calculations to ensure compliance with th pplicable norms and standards. Failure to consult and heed the advice of a structural engineer will free Hilti from any liability. It is essential that the product is used strictly in accordance with the applicable Hilti instructions for use, within the application limits specified in the Hilti technical data sheets, technical specifications and supporting product literature, and that the relevant application limits are not exceeded at any time. All rights reserved by Hilti Corporation. Duplication, utilization and/or publication of drawings contained in this manual are not permitted unless expressly agreed by Hilti Corporation.

| MFP-L NW $803 / 4{ }^{\prime \prime}$ | 310315 |
| MFP-L NW 4"3/4" | 310316 |
| MFP-L NW 125 3/4" | 310317 |
| 1x MFP-GP $3 / 4$ " base plate | 310319 |
| 1x GR-G $3 / 4$ " threaded pipe | 56429 |
| 2x HST3 M12x105 30/10 stud anchor | 2105718 |

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - MFP-L fixed point: imperial size connection boss | 11 | Fixed point sets | Concrete |
| General comments |  | Threaded parts |  |
| - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  |  |  |

## Heating Applications - MFP-L Fixed Point With Imperial Connection

## Type H-FP2

- Limited to 1x DN 125 (O.D. 139.1 mm ) steel pipe
- Max. axial load 2 kN at an axial distance of 150 mm
- Max. vertical load 15.0 KN
- No insulation on the pipe at the fixed point

Bill of materials

| Reference | Item no. | Description | Piece | Length ( m ) |
| :---: | :---: | :---: | :---: | :---: |
| (1) | 2105718 | HST3 M12x105 30/10 stud anchor | 2 | - |
| (2) | 310319 | MFP-GP $3 / 4$ " base plate | 1 | - |
| (3) | 56429 | GR-G 3/4" threaded pipe | 1 | Depends on distance |
| (4) | 310317 | MFP-L NW 125 3/4" fixed point pipe ring | 1 | - |

Application description
Heating - MFP-L fixed point: imperial connection boss
General comments

- Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact
- Loading and load impact must always be compared with 3D capacity limits for every single part of the application

Application

Base material Concrete
Product line

Max. 2 kN at 150 mm

## Fixed Point On Concrete - MFP-L Fixed Point Metric Connection Options

## MFP-L no sound insulation

| MFP-L fixed point set with M20 connection |  |
| :--- | ---: |
| 1x MFP-L fixed point pipe ring |  |
|  | See table below |
| 1x MFP-GP M20 base plate | 257001 |
| 1x AM20x1000 threaded rod | 216425 |
| 2x HST3 M12x105 30/10 stud anchor | 2105718 |

Application description
Heating - MFP-1a fixed point
General comments

- Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact
- Loading and load impact must always be compared with 3D capacity limits for every single part of the application

Application

Base material Concrete
Product line
MFP fixed points
Capacity limit
Max. 3 kN at 160 mm

## Fixed Point On Concrete - MFP-1 Fixed Point Options

MFP-1 - no sound insulation

| MFP-1 fixed point set |  |
| :--- | ---: |
| 1x MFP-NW fixed point pipe |  |
| ring | See table below |
| 1x MFP-BP 20 basic set * | 247827 |

Application description
Heating - MFP-3 fixed point
General comments

- Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact
- Loading and load impact must always be compared with 3D capacity limits for every single part of the application

Application

## Fixed Point On Steel - <br> MFP-2 Fixed Point Incl. Sub-structure Options

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - MFP-2 fixed point: metric connection boss | 11 | Fixed point sets | Steel |
| General comments |  | MQ System |  |
| - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Threaded parts |  |

## Heating Applications - MFP-2 Fixed Point On Steel Structure

## Type H-FP7

- Limited to 1x DN 250 (O.D. 273.0 mm ) steel pipe
- Max. axial load 3.05 kN at a axial distance of 500 mm
- No insulation on the pipe at the fixed point

Additional capacity limits
This particular case is a very complex, but relatively common structure. Every individual part is influenced by several factors which can vary. Proper evaluation must be done based on the set of loads to which each individual part is subjected, compared to their loading capacity limits.
The most common limiting factors are the brace to channel connector, the channel itself and slippage at the beam clamps.

## Application description

Heating - MFP-2 fixed point with bracing on both sides

## General comments

- Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact
- Loading and load impact must always be compared with 3D capacity limits for every single part of the application

Application

Base material Steel
Product line MFP fixed points
Capacity limit

## Primary Heating Media Collector Bracket - <br> MIQ System Frame - Pipe Ring Connections

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - Primary heating media collector bracket |  | MIQ System |  |
| General comments |  | MQ-F Saddle nuts |  |
| - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Pipe rings |  |

## Primary Heating Media Collector Bracket MiQ System Frame - Sliders / Rollers Connections

| Application description |
| :--- |
| Heating - Primary heating media collector bracket |
| General comments |
| - Application subject to thermal expansion impact, no seismic, no fatigue, |
| no high/low temperature impact |
| - Loading and load impact must always be compared with 3D capacity |
| limits for every single part of the application |

## Primary Heating Media Collector Bracket MIQ System Frame - Pipe Shoe Connections

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - Primary heating media collector bracket |  | MIQ System |  |
| General comments |  | MI System |  |
| - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | Pipe shoes |  |

## Primary Heating Media Colleotor Bracket - <br> MIQ System Frame - U-bolt Oonnections

| Application description | Application | Product lines | Base material |
| :---: | :---: | :---: | :---: |
| Heating - Primary heating media collector bracket |  | MIQ System |  |
| General comments |  | MI System |  |
| - Application subject to thermal expansion impact, no seismic, no fatigue, no high/low temperature impact <br> - Loading and load impact must always be compared with 3D capacity limits for every single part of the application |  | U-bolts |  |

Heating

## Primary Heating Media Oolleotor Bracket MQ System Frame - Wall to Wall cirder

Wall to wall application BOM for entire solution without pipe rings, pipe ring connections and sliders / rollers
Girder (channel)
2x MIQ-90 3m...m girder 2119866
Base material connector
2x MIQC-C90 base connector (incl. connectivity parts)
on one side screw are not used 2120144 Anchors
8x HST3-R M16x135 35/15 stud anchor 2105876

| Application description |
| :--- |
| Heating - Primary heating media collector bracket |
| General comments |
| - Application subject to thermal expansion impact, no seismic, no fatigue, |
| no high/low temperature impact |
| - Loading and load impact must always be compared with 3D capacity |
| limits for every single part of the application |

## Primary Heating Media Collector Bracket - <br> MI System Frame

Hilti strongly advises customers to verify the respective product application for the intended use by consulting a structural engineer and making the necessary calculations to ensure compliance with the
applicable norms and standards. Failure to consult and heed the advice of a structural engineer will free Hilti from any liability. It is essential that the product is used strictly in accordance with the applicable Page 261 Hilti instructions for use, within the application limits specified in the Hilti technical data sheets, technical specifications and supporting product literature, and that the relevant application limits are not exceeded at any time.
