

General business conditions / legal information

Hilti continually endeavors to further develop and improve its products and services. As a result, this "Installation Technical Manual – Technical Challenges – Fire resistance" may also be subject to change from time to time. The customer is thus required to regularly check whether a new version of the manual has been made available on the Hilti websites. Only the version of the manual that is currently available on the Hilti websites is considered pertinent. Any and all information and data contained in the manual concern solely the use of Hilti products and are based on the principles, formulas and safety regulations in accordance with Hilti's technical directives and operating, mounting and installation instructions, etc., which must be strictly complied with. The building materials and base materials as well as the environmental conditions vary, all information and data are based upon standards and assumptions that were accepted at the time of their validity. The Hilti product portfolio referred to in the manual can vary from country to country. All the numbers included in the manual are average values. Therefore, application-specific tests must be carried out before using the corresponding Hilti product. The results of the calculations carried out with the help of the manual are essentially based upon the data used by the customer. Therefore the customer is solely responsible for making sure that the data it uses is free of errors, complete and relevant. The customer is also solely responsible for ensuring that the results of the calculation are checked and approved by an expert, in particular with regard to the adherence with the applicable standards and approvals, before the customer uses this for its specific systems/equipment. The manual is designed as an aid for interpreting standards and approvals. It does not guarantee that the results will be free of defects, accurate and relevant, nor does it guarantee the suitability for a specific application. The customer must implement all the required and appropriate measures in order to use the manual as a means of preventing or limiting damage. All the calculation results and construction drafts are recommendations and must be confirmed by a professional builder and/or structural engineer in order to ensure that the calculation results and drafts for the locally applicable legal and project-specific requirements for the customer or for its project are suitable and appropriate.

Introduction

Hilti offers a variety of fire-tested products in the areas of fire protection, fastening technology and installation technology, and therefore plays a major role in supporting structural and system fire protection to the effect that the people in the building can be evacuated, while ensuring safe access for the fire department and rescue teams. Protecting the escape and emergency routes is of paramount importance. For this reason, fire protection requirements are becoming increasingly important around the world.

Modern buildings house a variety of mechanical and electrical systems. Fire protection-related systems such as smoke extraction ducts, sprinkler piping and cable runs with functional integrity requirements (e.g. power supply for firestop shutters or ventilation and smoke extraction systems etc.) are crossed in many cases by pipes that are not related to fire protection, or the pipes are laid over a suspended fire protection ceiling due to lack of space. In the event of a fire, if the pipe supports fail or are severely deformed, this can seriously impact the required fire resistance time of the fire protection-related building components that are installed beneath. Therefore the installation positioned above the fire protection-related application (e.g. a suspended ceiling) must be guaranteed to have the same level of fire resistance as the structure below. This also applies in particular to escape and emergency routes where the suspended ceiling often is intended to protect the escape routes against flames and prevent the penetration of smoke and fumes.

A suspended ceiling with fire protection requirements must ensure the required fire resistance time in the event of fire exposure from both above and below. It must be noted that a fire can develop above the suspended ceiling due to the presence of flammable materials, e.g. as a result of retrofitting. Falling pipes and other installation components can damage a fire protection ceiling or cause it to collapse. Furthermore, severe deformations of the suspensions and support structures can result in partial damage to the suspended ceiling and thus impair the ceiling's fire-protection function.

In the event of a fire, if a suspended ceiling is damaged, the smoke that has collected in the ceiling cavity can spread into the areas within the building below. This can make it very difficult or even impossible for the people who are in the affected areas to orient themselves. Subsequently, for the people trying to escape there is a very high risk of fatality due to exposure to smoke and fumes. Therefore, it must be ensured that the function of escape and emergency routes is not affected during the entire required fire resistance time. Support systems installed above must under no circumstances affect the required fire resistance time of fire protection-related equipment or structures installed below, such as cable runs, ventilation, smoke extraction and electrical ducts as well as fire protection ceilings.

Hilti fire-resistance typicals during the fire test

How to read this manual

In this manual, you will find the Hilti fire resistant modular support systems typicals. The following pages contains typical applications for pipe and duct supports. These typicals contains axonometric view with description, loading capacity limits and bill of material. For pipe application typicals, pipe rings selection have to be done using pipe rings table that you will find at end of this manual.

All the information used in this manual came from the "Installation Technical Manual - Technical Challenges - Fire resistance". There you can find all details, norms and used annexes. For more information, please contact your local Hilti expert for support.

General informations about fire-resistance typical
 Include name, used channel or bracket, fire-resistance time and maximum deformation of the channel.

Axonometric view
 with references to the bill of materials.

Load schemes
 with quantity of load.

Bill of material for one or multiple loads
 All item numbers and number of pieces of each item necessary to assemble this application.

Fire resistance typicals

Fire Resistance Applications - Trapeze On Rods On Concrete

Channel MQ-41 or MQ-41 LL

Possible ultimate loads depending on the required fire resistance time 30 minutes and limited deformation of the channel ≤ 50 mm.

Trapeze on rods - Loading capacity limits

Channel: MQ-41 or MQ-41 LL

Fire resistance time: 30 minutes

Deformation of the channel: ≤ 50 mm

Pipering saddle	Span width (mm)	Single load (kN)	Multiple load (kN)
M 8	350	0.40	3 x 0.30
	500	0.30	3 x 0.20
	700	0.25	3 x 0.12
M 10	350	0.50	3 x 0.35
	500	0.40	3 x 0.25
	700	0.30	3 x 0.15

Fire Resistance Applications - Trapeze On Frame On Concrete

Vertical channel MQ-41/3 and horizontal channel MQ-41 D

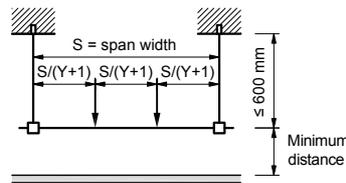

Possible ultimate loads depending on the required fire resistance time.

Single load scheme

Multiple load scheme

Note: Y = Quantity of loads

Trapeze on Frame - Loading capacity limits
Channel: Horizontal MQ-41 D and vertical MQ-41/3
Fire resistance time: 30, 60, 90, 120 minutes

Fire resistant time	Span width (mm)	Single load		Multiple load	
		Load (kN)	Min. distance (mm)	Load (kN)	Min. distance (mm)
30 minutes	700	2.54	284	6 x 0.64	50
	1000	2.46	424	9 x 0.32	124
	1250	1.98	458	11 x 0.24	139
60 minutes	700	1.48	239	6 x 0.45	90
	1000	1.17	234	9 x 0.19	103
	1250	1.00	470	11 x 0.12	97
90 minutes	700	1.09	148	6 x 0.32	110
	1000	0.76	266	9 x 0.14	116
	1250	0.67	355	11 x 0.08	136
120 minutes	700	0.87	161	6 x 0.25	84
	1000	0.56	127	9 x 0.11	122
	1250	0.51	394	11 x 0.06	205

Overview of fire-tested piperings

Hilti has tested various types of pipe ring over the last few years in accordance with the RAL quality guideline GZ-656 [6]. Furthermore, in the past other rings were fire-tested and evaluated by IBMB in Braunschweig. The corresponding RAL and IBMB test reports are summarized in annex 3.

Critical areas of suspended pipe rings when exposed to fire:

- Connection boss
 - Welded seam
 - Thread failure, internal thread on connection boss or threaded rod

- Closing mechanism
 - Joint
 - Screw
 - Quick-lock closure

Pipering selection

Hilti fire-tested galvanized pipe rings

The following conditions must be clarified before a suitable pipe ring can be determined based upon the table:

1. The applicable pipe diameter.
2. Calculation of pipe weight per meter, taking the filling and possible insulation into account.
3. Definition of the available space between the pipe ring and relevant fire protection applications that are positioned below.
4. Clarification of the required fire resistance time.

The following table is used to clarify whether the pipe weight is lower than the maximum load capacity of the pipe ring with the specified spacing of the suspensions. Furthermore, it is possible to read whether the spacing is sufficient between the pipe ring and a classified building component or system that is installed below.

Cutting and distance of the cut from the oblong hole edge for head rail and trapeze on rods applications

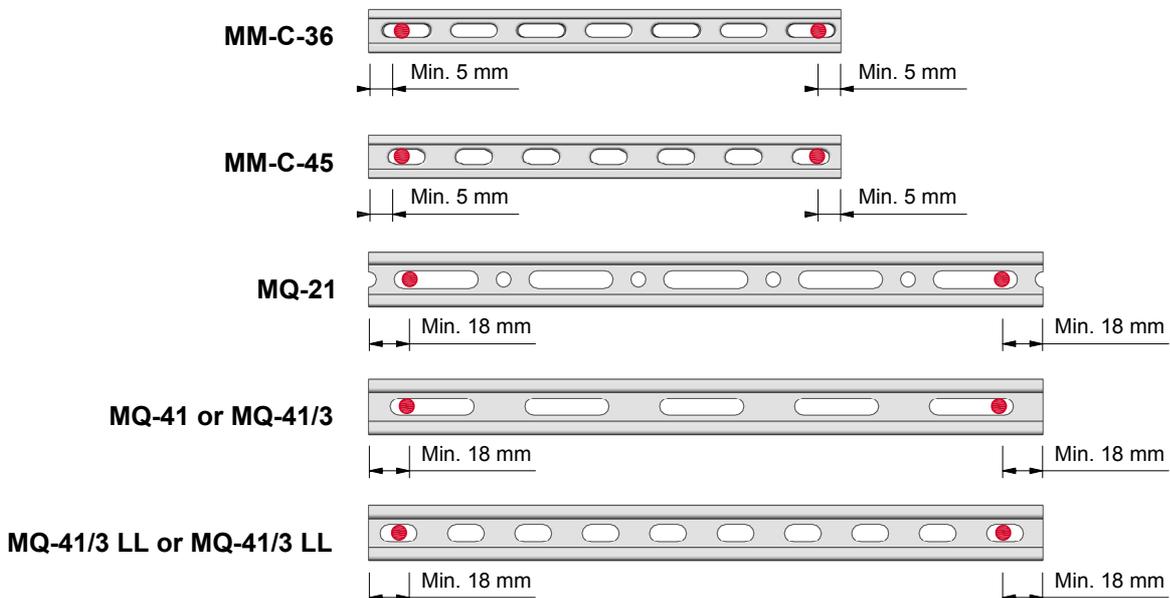

Cutting

To guarantee the loads recommended in this manual, there is an important cutting rule that has to be followed. The **oblong holes** must not be cut. It does not apply for **round holes**.

Distance of the cut from the oblong hole edge

There must be a minimum distance between the cut and oblong holes, see details below.

Annexes

There is a list of used annexes:

Annex 1: Calculation of the deformation of installation channels exposed to fire – MFPA Leipzig GmbH

Annex 2: Fire protection design of installation systems – Process steps

Annex 3: IBMB and RAL test reports – Pipe rings

Annex 3a: IBMB test report – MPN-QRC

Annex 3b: IBMB test report – MPN-RC

Annex 3c: IBMB test report – MP-MX/MXI

Annex 3d: RAL test report – MPN-LI

Annex 3e: RAL test report – MP-HI

Annex 3f: RAL test report – MP-MI

Annex 3g: RAL test report – MP-SRN

Annex 3h: IBMB test report – MP-SRNI

Annex 4: IBMB test report – Roller connector

Annex 5: IBMB test reports – Installation channel systems

Annex 5a: IBMB test report – MM installation channel system

Annex 5b: IBMB test report – MQ-21 & MQ-41 installation channel system

Annex 5b: IBMB test report – MQ-41/3 installation channel system

Annex 5d: IBMB test report – U-support

Annex 6: Assessment - IBB, Germany Page

Anlage 7: Fire-tested Hilti anchors Page

Annex 7: Fastening Technology Manual for Building Construction and Engineering Construction, issue 08/2015

All these annexes are available in german in the "**Installation Technical Manual - Technical Challenges - Fire Resistance**" and the english version are available on request. For support please contact your local Hilti expert.
